---

I have an issue where a tool is not being recognized by our existing Cloudflare Load Balancer (CLB). We have re-tested it against a local server (Ubuntu 16.04 LTS) and it is working fine. Since I am developing a web service and the tool does not work with the tool I am using it to test I have built a small web service that we can manually trigger. The test site is The error we get when we trigger the service is the following. Fatal error: Uncaught exception 'Psr\Http\Client\InvalidArgumentException' with message 'The class 'MbSynchronize' does not exist and could not be found. Are you sure this is a valid namespace name?' in /home/myusername/workspace/mb/vendor/nsuser/symfony-psr-http-message-bridge/Client/Channel.php on line 15 The code is as follows. client = Client::factory('unix:///tmp/mbs-sync.sock'); } public function createStream(Request \$request) { \$event = new KernelEvents(); \$event->addListener( KernelEvents::REQUEST, function (\Symfony\Component\HttpKernel\Event\GetResponseEvent \$event) { \$content = "Request completed "; 82157476af
